What is Statistics?

- Study of collection, analysis, interpretation, presentation, and organization of data [1]
- A branch of mathematics dealing with the collection, analysis, interpretation, and presentation of masses of numerical data [2]
- The practice or science of collecting and analyzing numerical data in large quantities, especially for the purpose of inferring proportions in a whole from those in a representative sample. [3]

Questions about Data

1. Descriptive
 - Explain what actually happens
2. Relational
 - Focus on relationship between two or more variables
3. Causal
 - Figure out cause/effect of one variable on the others

Questions about Data (cont.)

1. Descriptive

- Explain what actually happens

Much more Republican				
STATE	DEM.	REP.	OTH.	% RPT.
Ala.	34%	62%	2%	100%
Alaska	37%	51%	6%	99%
Ark.	34%	61%	3%	100%
Idaho	28%	59%	7%	100%
Kan.	36%	57%	5%	99%

Much more Democratic				
STATE	DEM.	REP.	OTH.	% RPT.
Calif.	62%	32%	3%	100%
D.C.	91%	4%	2%	100%
Hawaii	62%	30%	4%	100%
Md.	60%	34%	3%	99%
Mass.	60%	33%	4%	100%

Questions about Data (cont.)

2. Relational

- Focus on relationship between two or more variables

Questions about Data

3. Causal

- Figure out cause/effect of one variable on the others

GOP Gains Among Non-College Degree

The White College/Non-College Divide Was Much Wider This Year

White college graduates favored Trump by 4 points this year, a stark contrast to whites without college degrees, who preferred Trump by 39 points. Compared to past polling data, that suggests that this year's educational divide among whites is far more pronounced than it has been in recent years.

Questions about Data (cont.)

1. Descriptive

- Explain what actually happens

What we are familiar with:
mean, variance

2. Relational

- Focus on relationship between two or more variables

3. Causal

- Figure out cause/effect of one variable on the other

What we will learn in this course.

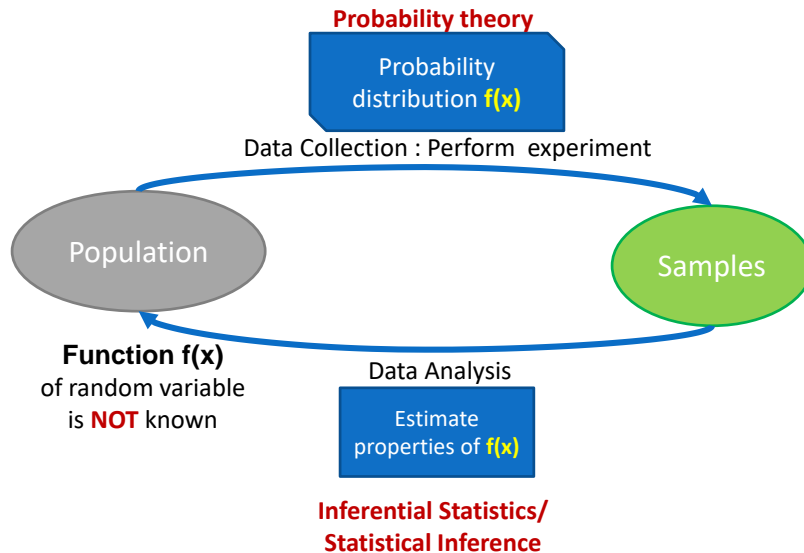

Terminologies

- Population
 - Collection of all data
- Sample
 - Subset of data
 - Also called observation or data

Inferential Statistics

Random Variable (RV)

- Function that associates a numerical value with each outcome in experiment
- Random variable is represented by uppercase letter
 - Example: X, Y, Z
 - Note: lower case letter is used for outcome value.
- Example: coin toss
 - Outcome of coin-tossing experiment = {head, tail}

$$X = \begin{cases} 1 & \text{if outcome=head} \\ 0 & \text{if outcome=tail} \end{cases}$$

Bernoulli RV:
Outcome with two possible values

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 13

Department of Computer Engineering

Types of Random Variables (RV)

- Discrete random variable
 - Outcomes come from finite set
 - Example:
 - Coin: {0, 1}
 - Dice: {1, 2, 3, 4, 5, 6}
- Continuous random variable
 - Outcomes come from interval(s) of numbers (infinite set)

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 14

Department of Computer Engineering
Kasetsart University

Probability Distribution

- Probability = likelihood that each outcome will occur
- Probability density function(pdf) for continuous RV
- Probability mass function (pmf) for discrete RV
 - Links each outcome with probability of its occurrence

- Example: coin toss

- Unbiased coin

$$X = \begin{cases} 1 & \text{if outcome=head} \\ 0 & \text{if outcome=tail} \end{cases}$$

$$P(X = 1) = 0.5$$

$$P(X = 0) = 0.5$$

Probability Distribution (cont.)

- Example 2: Standard normal variable
 - Probability distribution = Gaussian distribution

$$X \sim \text{Gaussian RV}$$

$$x = (-\infty, \infty)$$

$$P(X = x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$$

with mean = 0,
standard deviation = 1

Basic Properties of PDF/PMF

- $0 \leq P(x) \leq 1$
- $\sum P(X) = 1$ for all possible values of X
Or 100%

Image source: <https://encrypted-tbn1.gstatic.com/images?q=tbn:ANd9GcQKl9cHZ-SxMZMlZuZFqy8wRSq4j-mOX8rLU1bkmYW9hf2Pw5WeQ>

Cumulative Distribution Function (CDF)

- Sum of probabilities up to x

$$F(x) = P(X \leq x) = \sum_{y: y \leq x} P(y)$$

Image source: http://oneau.files.wordpress.com/2011/02/norm_cdf.png

Bernoulli Random Variable

- Random variable X with two outcomes
- Range of outcome value = $\{0,1\}$

$$P(X) = \begin{cases} p & , x = 1 \\ 1 - p & , x = 0 \end{cases}$$

Mean	p
Variance	$p(1-p)$

Example:

- Head vs. Tail

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 21

Department of Computer Engineering
Kasetsart University

Binomial Random Variable

- Random experiments that independently repeat n times
- Let X = number of times that a certain event appears
- Range of outcome value = $\{0,1,2, \dots, n-1, n\}$

$$P(X = k) = \binom{n}{k} p^k (1-p)^{n-k}, k \in \{0,1, \dots, n-1, n\}$$

Example:

- Toss coins n times and observe k heads

Mean	np
Variance	$np(1-p)$

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 22

Department of Computer Engineering
Kasetsart University

Geometric Random Variable

- Random experiments that independently repeat n times
- Let X = number of failures until a success occurs
- Range of outcome value = $\{0, 1, 2, \dots\}$

$$P(X = k) = (1 - p)^k p, \quad p = \text{prob}(\text{success}), k \in \{0, 1, 2, \dots\}$$

Example:

- Observe k system-failures, until a system success occurs

Mean	$(1-p)/p$
Variance	$(1-p)/p^2$

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 23

Department of Computer Engineering
Kasetsart University

Poisson Random Variable

- Let X = number of events in a certain period
 - Event occurs randomly both in time and space
- Range of outcome value = $\{0, 1, 2, \dots\}$

$$P(X = k) = \frac{\lambda^k}{k!} e^{-\lambda}, \quad k \in \{0, 1, 2, \dots\}$$

Mean	λ
Variance	λ

λ = average number of events

Example:

- Particle emission of radioactive substances
- Test a system and find out possibility of k successes (or failures) to occur

Supaporn Erjongmanee
fengspe@ku.ac.th

Uniform Random Variable

- Random variable that has equal probability
- Range of outcome value = $[a, b]$

$$P(X = x) = \frac{1}{b - a}$$

Example:

- Real value that is likely to occur between $[a, b]$

Mean	$(a+b)/2$
Variance	$(b-a)^2/12$

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 26

Department of Computer Engineering
Kasetsart University

Normal Random Variable

- Random variable that has distribution Gaussian (normal) distribution
- Common and well-known distribution

$$P(X = x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

Mean	μ
Variance	σ^2

Supaporn Erjongmanee
fengspe@ku.ac.th

Statistics in Computer Engineering
Slide 27

Department of Computer Engineering
Kasetsart University

Exponential Random Variable

- Random variable that models time between occurrences of events

$$P(X = x) = \begin{cases} \lambda e^{-\lambda x} & , x \geq 0 \\ 0 & , x < 0 \end{cases}$$

λ = rate that event occurs

Mean	$1/\lambda$
Variance	$1/\lambda^2$
